

PRP FOR HAIR RESTORATION

The Facts:

- 85% of men see hair thinning by the age of 50
- 40% of hair loss sufferers are female

PRP, or Platelet Rich Plasma, therapy is a breakthrough treatment to help those who are suffering from unwanted hair loss, with little to no downtime.

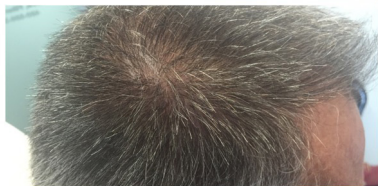

Step 1: A small amount of blood is drawn in our office.
Step 2: The blood is spun in a centrifuge and the PRP is separated and removed from the rest of the blood.
Step 3: The highly concentrated platelet rich plasma (PRP) is then injected into the scalp in small injections.
Step 4: Patients can continue normal activity after the treatment, there is no downtime with a PRP hair injection.

THE RESULTS!

Before and after photos courtesy of Dr. Rapaport

Most patients require multiple treatments to see optimal results, though some may see results in one treatment. Results will vary, but in general, patients should expect to see a gradual increase in natural hair growth over the course of several months.
